

# RECOMMENDATIONS FOR THE DIAGNOSIS AND CLASSIFICATION OF DIABETES MELLITUS 2014

## CRITERIA FOR TESTING FOR DIABETES IN ASYMPTOMATIC ADULT INDIVIDUALS – TABLE 1

DIABETES TYPE	RISK FACTORS and FREQUENCY OF SCREENING
<i>Type 1</i>	There is evidence to suggest that early diagnosis may limit acute complications and extend long-term endogenous insulin production. While there is currently a lack of accepted screening programs, one should consider referring relatives of those with type 1 diabetes for antibody testing for risk assessment in the setting of a clinical research study ( <a href="http://www2.diabetestrialnet.org">http://www2.diabetestrialnet.org</a> )
<i>Type 2</i>	<ol style="list-style-type: none"> <li>Testing should be considered for all adults who are overweight (BMI <math>\geq</math> 25) and have additional risk factors: <ul style="list-style-type: none"> <li>History of cardiovascular disease</li> <li>first degree relative with diabetes</li> <li>polycystic ovary syndrome</li> <li>HDL <math>\leq</math> 35 mg/dl or triglyceride <math>\geq</math> 250 mg/dl</li> <li>Other clinical conditions associated with insulin resistance (obesity, AN)</li> <li>high risk ethnic population (African American, Latino, Native American, Asian American, Pacific Islanders)</li> <li>habitual physical inactivity</li> <li>delivered baby <math>&gt;</math> 9 lbs, GDM</li> <li>HTN <math>\geq</math> 140/90 or on meds</li> <li>A1c <math>\geq</math> 5.7%, IGT or IFG</li> </ul> </li> <li>In the absence of the above risk, start testing for diabetes at age 45</li> <li>If results normal, repeat test at 3 year intervals or more frequently depending on risk</li> </ol>

## TESTS TO DIAGNOSE DIABETES – TABLE 2

STAGE	For all the below tests, in the absence of unequivocal hyperglycemia, results should be confirmed by repeat testing.			
	A1C <i>NGSP certified &amp; standardized assay</i>	Fasting* Plasma Glucose (FPG) <i>*No intake 8 hrs</i>	Random Plasma Glucose	Oral Glucose Tolerance Test (OGTT) 75-g
Diabetes	A1C $\geq$ 6.5%	FPG $\geq$ 126 mg/dl	Random plasma glucose $\geq$ 200 mg/dl plus symptoms <sup>1</sup>	Two-hour plasma glucose (2hPG) $\geq$ 200 mg/dl
Increased risk of diabetes	A1C 5.7 - 6.4%	Impaired Fasting BG (IFG) = FPG 100-125 mg/dl	<sup>1</sup> Random = any time of day w/out regard to time since last meal; symptoms include usual polyuria, polydipsia, and unexplained wt loss.	Impaired Glucose Tolerance (IGT) = 2hPG 140 -199 mg/dl
Normal	A1C $<$ 5.7%	FPG $<$ 100 mg/dl		2hPG $<$ 140 mg/dl

## GESTATIONAL DIABETES (GDM)\*

SCREENING	TEST	DIAGNOSTIC CRITERIA
At the first prenatal visit, screen for undiagnosed type 2 in those w/ risk factors as listed in Table 1	Standard Diagnostic Testing and Criteria as listed in Diagnosing Diabetes -Table 2	Standard Diagnostic Testing and Criteria as listed in Diagnosing Diabetes -Table 2
Screen for GDM at 24-28 weeks of gestation for all pregnant women not known to have diabetes.	Can use either IADPSG consensus: <b>“One Step” 75-g OGTT</b> fasting and at 1 and 2 h (perform after overnight fast of at least 8 h)  <i>Or can use Two Step</i>	<b>One Step:</b> GDM diagnosis when ANY of following BG values are exceeded: <ul style="list-style-type: none"> <li>Fasting <math>\geq</math>92 mg/dl,</li> <li>1 h <math>\geq</math>180 mg/dl</li> <li>2 h <math>\geq</math>153 mg/dl</li> </ul>
Screen women w/ GDM for diabetes 6-12 wks postpartum <i>*Please see reference below for complete guidelines.</i>	<b>“Two step” NIH Consensus – Step 1:</b> 50gm glucose load (non fasting) w/ plasma BG test at 1 hr. If BG $\geq$ 130-140*, go to <b>Step 2</b> $>$	<b>Two Step –Step 2 – 100g OGTT</b> (fasting) GDM diagnosis if at least 2 of 4 plasma BG measured at 1h, 2h, 3h after OGTT are met or exceeded.*
